Description:

Installed in broadcasting control center or computer, the broadcasting system management and control software serves as an integrated management platform for data exchange, system operation and function operation.

Features:

- ※ Network audio control software is the core of the entire system, supporting the operation of broadcast terminals in the system, basic parameter configuration of broadcast terminals, and responsible for audio stream on-demand services, scheduled task processing, terminal management and authority management;
- ※ Manage program library resources, provide scheduled playback and real-time on-demand media services for all terminals, respond to program playback requests from each terminal, and provide data interface services for each audio workstation;
- ※ Support up to 1,000 unicast tasks or program transmissions, support distributed deployment of multiple servers and server clusters;
- ※ Support custom terminal names, unlimited grouping, unlimited scheduled tasks, unlimited scheduled grouping, support unlimited audio acquisition and playback, scheduled playback, one-click call and playback;
- ※ Support multi-user, any level of sub-control management, support unlimited monitoring terminals, multi-task real-time monitoring, support unlimited environmental monitoring functions, and the program library supports unlimited files and unlimited folders management;
- ※ Support program scheduled offline playback tasks, support remote manual and intelligent control of terminal power;
- ※ Supports unattended work all day, supports power-off data protection, supports automatic discovery of bound

- ※ Supports any single or group call, music playback, timing, and ringing functions, supports remote wireless remote control, supports intelligent combination buttons, supports remote volume adjustment, playback, and song selection functions;
- ※ Supports the system's self-start function without login or logout, does not affect the operation of timing ringing and other functions, supports background recording, supports remote storage, and supports intelligent task recognition to start recording;
- ※ Supports digital audio intelligent recognition, professional studio management software, supports temporary task saving and editing and re-calling;
- ※ Supports custom terminal partition shortcut key operation, supports up to 5 or more task volumes;
- ※ Supports virtual terminal access, supports portable mobile client operation;
- ※ Supports full-area and partition fire linkage, supports fire N±N mode, supports manual alarm and digital alarm mixing;
- ※ Supports unified management of terminal login passwords, supports authorization range management, 10-level priority management, and supports easy automatic authorization;
- ※ Support task management, session management, hardware management, user management, authorization management, media management, network adaptive management;
- ※ Support full series of log query, filtering, retrieval, output, terminal startup, playback, management, control, online and offline, timing, triggering, fire, call, intercom, help, alarm, remote control, removal;
- ※ Adopt standard optional installation module, the software package includes system server software, relay server software, remote client software, broadcast client software, fire alarm software, support customer customized installation, realize the maximum reduction of system resource occupation, improve system operation efficiency, is the most flexible broadcast software in the industry;
- ※ Adopt background system service operation, which is the enterprise-level standard server working mode, the system can run automatically when it is turned on, and has higher stability and reliability than the software running in the foreground of the interface;
- ※ Windows service mode, support Win98~Win8.1 and other system platforms, built-in 7 major system services, and support system watchdog;
